### **DETAILED ACTION**

Applicants' arguments, filed 5/24/04, have been fully considered and they are deemed to be persuasive to overcome previous rejections of record. Rejections and/or objections not reiterated from previous office actions are hereby withdrawn. Upon reconsideration, the following rejections and/or objections are newly applied. They constitute the complete set presently being applied to the instant application.

### **PRIOR ART**

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 37, 38, 40-47, 51-55, and 58-62 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pinkel et al. (P/N 5,837,196).

Pinkel et al. describes the fabrication and use of fiber optic biosensors of biological binding partners in the title and abstract including high densities thereof. This is also summarized in column 7, lines 10-23. The fiber optical

Art Unit: 1631

arrays are very high in density with thousands of fibers in a square millimeter as described in column 8, lines 39-56. Species of fiber distributions including random distributions are described in column 8, line 63, through column 9, line 22. The random distribution of binding partners on the fiber optic bundle surface is described in column 9, lines 14-22. Attachment of the biological binding partners may be practiced via various surfaces including fibers, beads, etc. thus suggesting the use of beads for immobilizing the biological binding partners onto various surfaces including the fiber optical surfaces as instantly claimed.

Thus, it would have been obvious to someone of ordinary skill in the art at the time of the instant invention to practice various species including the random distribution of binding partners on the surfaces as instantly claimed because Pinkel et al. suggests and motivates species therein as instantly claimed.

### **CLAIM OBJECTIONS**

Claims 39, 56, 57, and 63 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

No claim is allowed.
